1: Find a formula for

$$1+4+7+\cdots(3n-2)$$

for positive integers then verify your formula by mathematical induction.

The formula is

$$1 + 4 + 7 + \dots + (3n - 2) = \frac{n(3n - 1)}{2}$$

for all positive integers, n.

PROOF: We will prove by induction that

$$1 + 4 + 7 + \dots + (3n - 2) = \frac{n(3n - 1)}{2}$$

for all positive integers n. Base Step: Let n = 1. Now, 3n - 2 = 3 - 2 = 1, and so the sum is equal to one. Now, consider the right side

$$\frac{1 \cdot (3 \cdot 1 - 1)}{2} = \frac{3 - 1}{2}$$
$$= \frac{2}{2}$$
$$= 1.$$

Thus, the formula is valid for n = 1.

We show that,

$$1 + 4 + 7 + \dots + (3(k+1) - 2) = \frac{(k+1)(3(k+1) - 1)}{2}$$

Now, assume that $1+4+7+\cdots(3k-2)=\frac{k(3k-1)}{2}$ is valid for all $k\in\mathbb{N}$. Add 3(k+1)-2 to both sides,

$$1 + 4 + 7 + \dots + (3k - 2) + (3k + 1) = \frac{k(3k - 1)}{2} + 3k + 1.$$

Next, write the right side with a common denominator and rearrange the numerator into our desired form,

$$1+4+7+\cdots(3k-2)+(3k+1) = \frac{k(3k-1)+6k+2}{2}$$

$$= \frac{3k^2-k+6k+2}{2}$$

$$= \frac{3k^2+5k+2}{2}$$

$$= \frac{(k+1)(3k+2)}{2}$$

$$= \frac{(k+1)(3(k+1)-1)}{2}.$$

Thus, by the principle of mathematical induction, $1+4+7+\cdots(3n-2)=\frac{n(3n-1)}{2}$.

2: Prove the following inequality for every positive integer n:

$$2! \cdot 4! \cdot 6! \cdots (2n)! > ((n+1)!)^n$$

PROOF: We proceed by induction. Since $(2 \cdot 1)! = (2!)^1$, the statement is true when n = 1. Assume that

$$2! \cdot 4! \cdot 6! \cdots (2k)! \ge ((k+1)!)^k \tag{1}$$

for some integer, k. We show,

$$2! \cdot 4! \cdot 6! \cdots (2k)! \cdot (2(k+1)) \ge ((k+2)!)^{k+1}.$$

Now, multiply either side of equation (1) by (2(k+1))!,

$$2! \cdot 4! \cdot 6! \cdots (2k)! \cdot (2(k+1))! \ge ((k+1)!)^k \cdot (2(k+1))!$$

Now, we show that $((k+1)!)^k \cdot (2(k+1))! \ge ((k+2)!)^{k+1}$ directly. Divide both sides by $((k+1)!)^k$,

$$\frac{((k+1)!)^k \cdot (2(k+1))!}{((k+1)!)^k} \ge \frac{((k+2)!)^{k+1}}{((k+1)!)^k}$$
$$(2k+2)! \ge \frac{((k+1)!)^{k+1}(k+2)^{k+1}}{((k+1)!)^k}$$
$$\ge (k+1)!(k+2)^{k+1}.$$

Now, divide by (k+1)!,

$$\frac{(2k+2)!}{(k+1)!} \ge \frac{(k+1)!(k+2)^{k+1}}{(k+1)!}$$

$$\underbrace{(k+2)\cdot(k+3)\cdots(2k+1)\cdot(2k+2)}_{k+1 \text{ factors}} \ge (k+2)^{k+1}.$$

Note that both sides involve the multiplication of integers k+1 times. However, all of the factors on the right are k+2, and exactly one of the factors on the left is k+2. Additionally, k of the factors on the left are greater than k+2. Thus, it is true that $((k+1)!)^k \cdot (2(k+1))! \ge ((k+2)!)^{k+1}$, and by induction.

3: Prove that for every real number x > -1 and every positive integer n,

$$(1+x)^n \ge 1 + nx$$

Proof: ■

4: Prove that $81|(10^{n+1} - 9n - 10)$ for every positive integer n.

PROOF: Base Case: Let n = 1. Now, $10^2 - 9 - 10 = 81$. Thus, $81 | (10^{n+1} - 9n - 10)$ when n = 1.

Induction Step: Now, assume that $81|(10^{k+1}-9k-10)$. Next, consider $10^{k+2}-9(k+1)-10=10^{k+2}-9k-19$. Now, subtract $10(10^{k+1}-9k-10)$ from both sides

$$10^{k+2} - 9(k+1) - 10 - 10(10^{k+1} - 9k - 10) = 10^{k+2} - 9k - 19 - 10(10^{k+1} - 9k - 10)$$
$$= 10^{k+2} - 9k - 19 - 10^{k+2} + 90k + 100$$
$$= 81(k+1).$$

Then, add $10(10^{k+1} - 9k - 10)$ to both sides,

$$10^{k+2} - 9(k+1) - 10 = 81(k+1) + 10(10^{k+1} - 9k - 10).$$

Since, $81|(10^{k+1}-9k-10)$, then $10^{k+1}-9k-10=81j$, for some $j \in \mathbb{N}$. Thus,

$$10^{k+2} - 9(k+1) - 10 = 81(k+1) + 10(81j)$$

= 81(k+1) + 81(10j)
= 81(k+1+10j).

Thus, $81|(10^{k+2}-9(k+1)-10)$. Therefore, $81|(10^{n+1}-9n-10)$ for all $n \in \mathbb{N}$.

5: A sequence $\{a_n\}$ is defined recursively by

$$a_1 = 1$$
, $a_2 = 2$; $a_n = a_{n-1} + 2a_{n-2}$,

for $n \geq 3$. Conjecture a formula for a_n and verify that your conjecture is correct.

PROOF: We prove by induction that for the sequence defined above, $a_n = 2^{n-1}$. Since, $a_1 = 2^0 = 1$, the formula holds for n = 1. Assume for an arbitrary k that $a_i = 2^{i-1}$ for every integer i with $1 \le i \le k$. We show that $a_{k+1} = 2^k$. If k = 1, then $a_{k+1} = a_2 = 2^1 = 2$. Since, $a_2 = 2$, it follows that $a_{k+1} = 2^k$ for k = 1. Now, we may assume that $k \ge 2$. Since k + 1 > 3, it follows that

$$a_{k+1} = a_k + 2a_{k-1}$$

$$= 2^{k-1} + 2 \cdot 2^{k-2}$$

$$= 2^{k-1} + 2^{k-1}$$

$$= 2 \cdot 2^{k-1}$$

$$= 2^k,$$

which is the desired result. By the strong principle of mathematical induction, $a_n = 2^{n-1}$, for all $n \in \mathbb{N}$.

6: Consider the sequence of Fibonacci numbers $\{F_n\}$, where

$$F_1 = 1, \ F_2 = 1, \ F_n = F_{n-1} + F_{n-2},$$

for $n \geq 3$.

(a) Prove $2|F_n$ if and only if 3|n.

PROOF: Since, 3|n, it is clear that n=3m for some $m\in N$. In the case where m=1, we have

$$F_n = F_3 = F_2 + F_1 = 1 + 1 = 2$$
